CLAIMS IN CURRENT FORM

- 3. (THREE TIMES AMENDED) A data controller, that is couplable to a host and coupled to a storage medium, microprocessor, local storage and a buffer memory, comprising a command queuing engine that creates a plurality of threads of sequential commands that exist simultaneously while minimizing interrupts associated to the commands.
- 16. The data controller of claim 3 wherein the command queueing engine includes a transfer extend generator that generates transfer extend entries.
- 17. The data controller of claim 16 wherein the transfer extend generator is coupled to the buffer memory to store the transfer extend entries.
- 18. The data controller of claim 3 wherein the command queuing engine includes a data retrieval channel.
- 19. The data controller of claim 18 wherein the command queueing engine further includes a status retrieval channel.

5

- 20. The data controller of claim 18 wherein the data retrieval channel is coupled to the buffer memory to retrieve transfer extend entries and to return used read pointers.
- 21. A data controller of a peripheral device having a storage medium and a processor, wherein the data controller minimizes interrupts to the processor by re-ordering a plurality of commands received from a host computer from an order of arrival into an order of sequence in the storage medium.
- 22. The data controller of claim 21, further comprising a command queueing engine configured to arrange the plurality of commands into at least one thread.
- 23. The data controller of claim 22, wherein the command queueing engine comprises:
- a transfer extend generator configured to generate transfer extend entries for a data transfer between the storage medium and a host computer; and
- a data retrieval channel coupled to receive the transfer extend entries for programming the data transfer.
- 24. The data controller of claim 23, wherein the command queueing engine further comprises a status retrieval channel.

5

- 25. The data controller of claim 24, wherein each of the retrieval channels are coupled to receive transfer extend entries and to provide used read pointers to a first storage device of the peripheral device.
- 26. A peripheral device that includes a data controller, a microprocessor, a buffer memory, local memory and a storage medium, and that is couplable to a host, wherein the data controller creates threads of a plurality of commands and generates interrupts at the beginning and end of the plurality of commands relative to a data transfer.
